

FIGURE 15.42. A model of deposits of northwestern Andros Island tidal flats. The inset gives details of levee deposits as they would appear in a core. Circled numbers refer to (1) *Uca* sp. (fiddler crab) burrows; (2) deep prism cracks in a tidal channel bar; (3) *Callinassa* burrows; (4) a packstone lens in tidal-channel deposits; and (5) the basal erosion surface of a tidal channel overlain by channel lag clasts of cemented protodolomite crust.
