
Text-fig. 14. A scheme compiled from the data of Greep and Chester Jones (1950*b*) of the various interrelationships of the sex steroids, gonadotrophins and corticotrophin with the adrenal cortex in the rat. The figures in circles are the organ weights in mg. in the different categories of male and female animals. The scheme is hypothetical and in particular the influence of gonadotrophins on the adrenal cortex is purely speculative (see discussion in text, page 103).
