

Along-stream section along axis of compound bar

Across-stream section of compound braid-bar tail that migrated downstream over confluence scour

Across-stream section of confluence scour and adjacent side bars that migrated downstream over a braid bar

Across-stream section of downstream end of channel fill

FIGURE 13.40. Qualitative models of channel deposits. Cross sections showing large-scale inclined strata, and their internal structures, associated with migration of compound bars, unit bars, and their superimposed bed forms for sandy rivers. Cross sections are hundreds of meters to kilometers across and meters to tens of meters thick. Vertical exaggerations are approximately 5. From Bridge (2006).
