

FIGURE 6.9. Internal structures of wind ripples and zibar. (A) Modern wind-ripple laminae in vertical and horizontal cross sections, from Padre Island. Dark parts of laminae are finer-grained than light parts. (B) Low-angle laminae associated with zibar on the backshore of a South Carolina beach. Images (C) and (D) show ancient wind-ripple laminae from Jurassic Page sandstone. In (C), the scale is a pen. Image (D) shows some ripple forms and low-angle cross strata. Photos (A), (C), and (D) courtesy of Gary Kocurek.
