*This document contains all the analyses presented in the book. Beyond this, additional, auxiliary analyses are provided, mostly to further analyze the properties of the data (skeweness, simplifying assumptions etc.) and to visualize the QCA solution formulas.*

*All replication files (datasets in csv format and an RMarkdown file that produces this document) can be found in the Harvard Dataverse at <https://doi.org/10.7910/DVN/URMOVC>*

*System setting and parameters under which the analyses were performed:*

- MacOS: Sonoma 14.0
- R: 4.2.2 “Innocent and Trusting”
- RStudio: 2023.06.0+421

# 1 Chapter 1: C. Q. Schneider and Makszin (2014)

The data come from Carsten Q. Schneider and Kristin Makszin 2014 article “Forms of welfare capitalism and education-based participatory inequality.”

[<https://doi.org/10.1093/ser/mwu010>] The paper analyses whether the degree of political inequality between social groups is shaped by features of the welfare capitalist system. This example is used in chapters 1 and 5.

*Outcome:*

- LPI = Low participatory inequality

*Conditions:*

- WC = High wage coordination
- UN = High union density
- EP = High employment protection
- LM = High labor market expenditure

## 1.1 Loading and checking the data for skeweness and ambiguous cases

To begin with, we load the data and check for skeweness and the presence of ambiguous cases (that is, cases with 0.5 fuzzy set membership score in a condition or the outcome set).

```
MACRO.d <- read.csv('SchneiderMakszin2014.csv', row.names = 1)

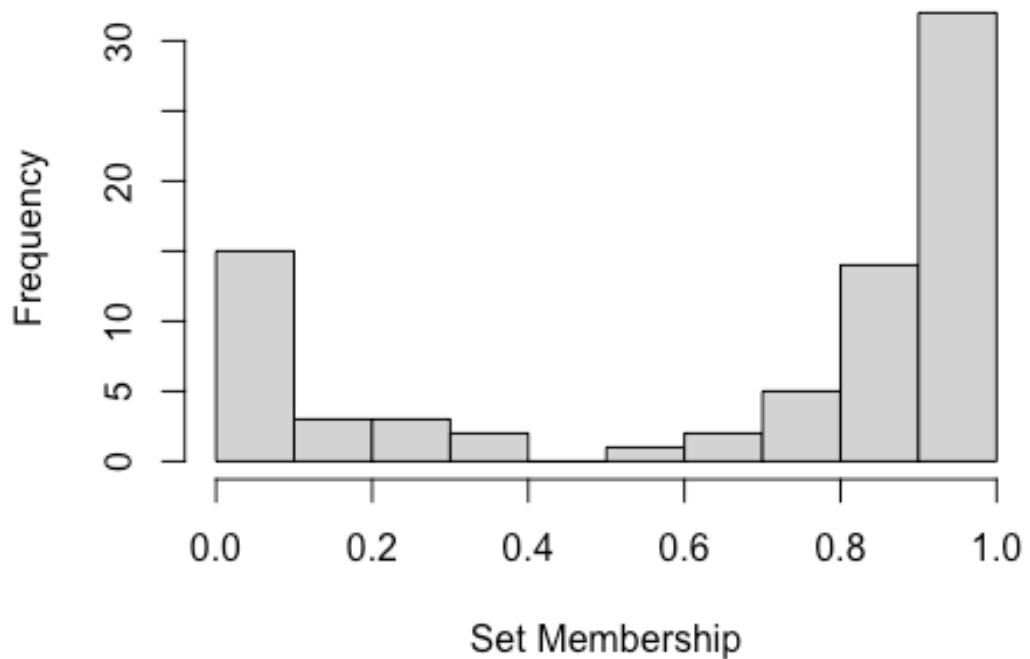

head(MACRO.d)

    LPI         WC         UN         EP         LM
AT00 0.00253846 0.908674751 0.7000518 0.724116810 0.5498694
AT05 0.00004670 0.908674751 0.1574641 0.545822265 0.5948249
BG95 0.90867475 0.091325249 0.9762687 0.975303710 0.4724572
BG00 0.83529226 0.010000000 0.6056057 0.908674751 0.1248358
BG05 0.50765793 0.010000000 0.2492102 0.500000000 0.0222146
CA95 0.72104641 0.000471777 0.6249398 0.003192034 0.8029896

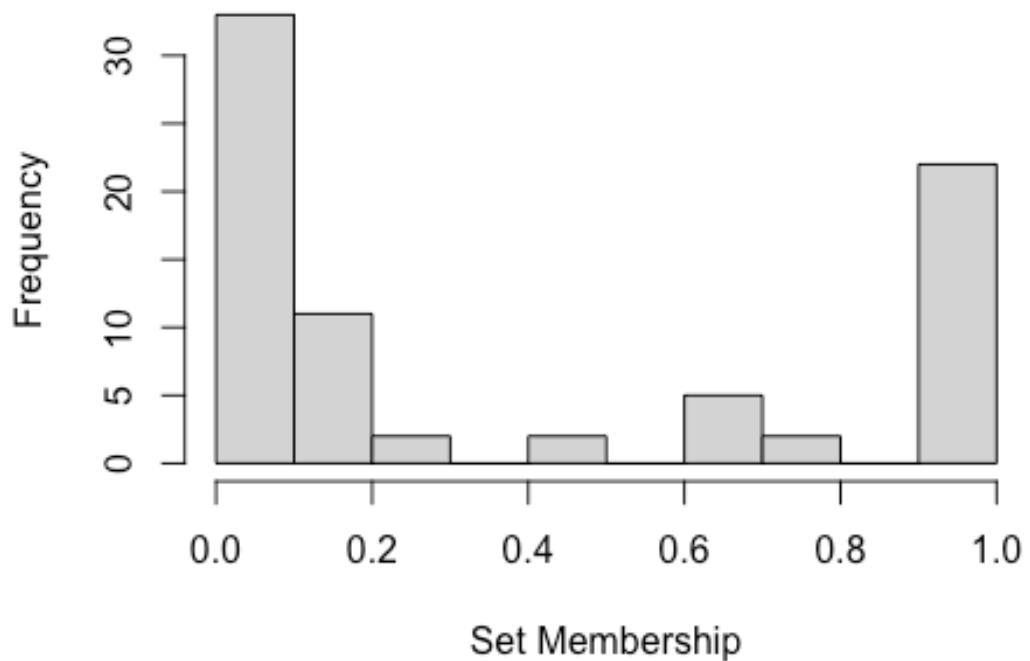

# conditions
conds <- c("WC", "UN", "EP", "LM")

# data diagnostics
skew.check(data = MACRO.d,
            hist = TRUE)
```

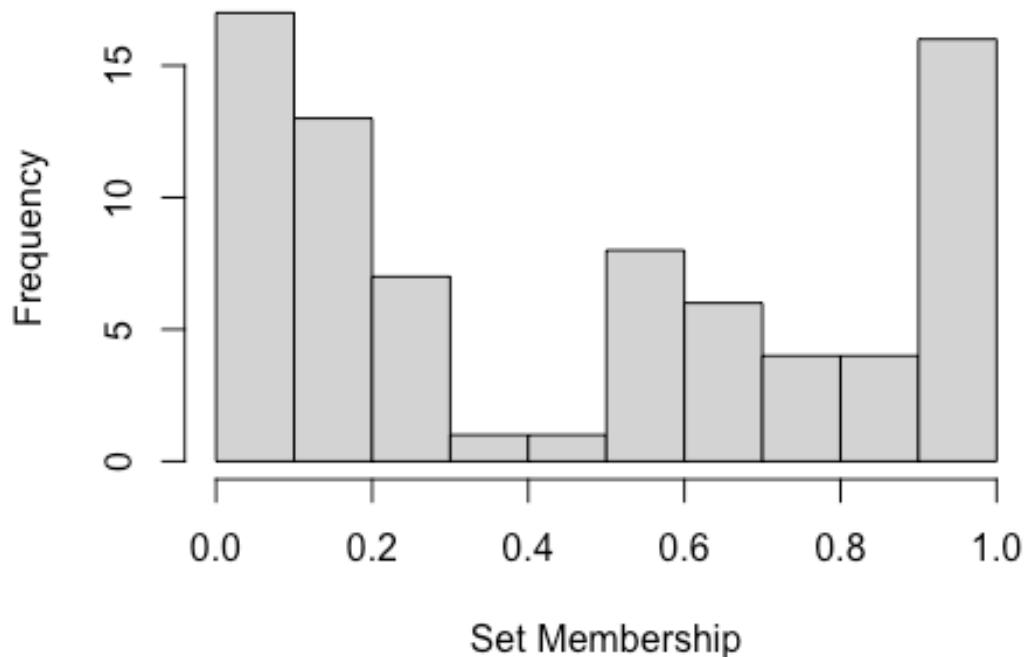

# LPI

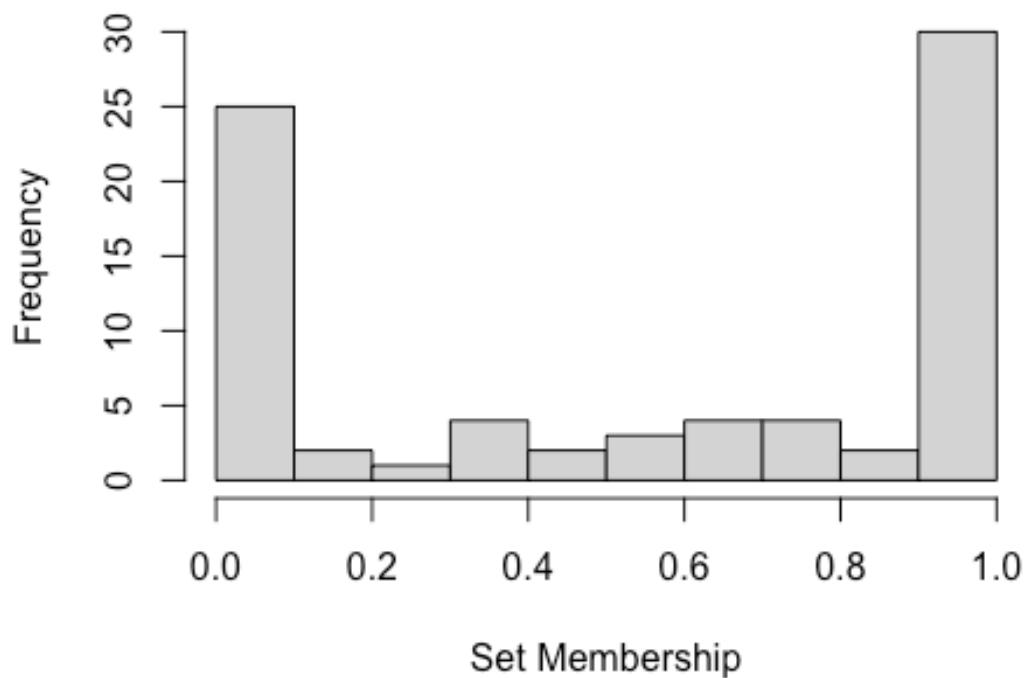

**WC**

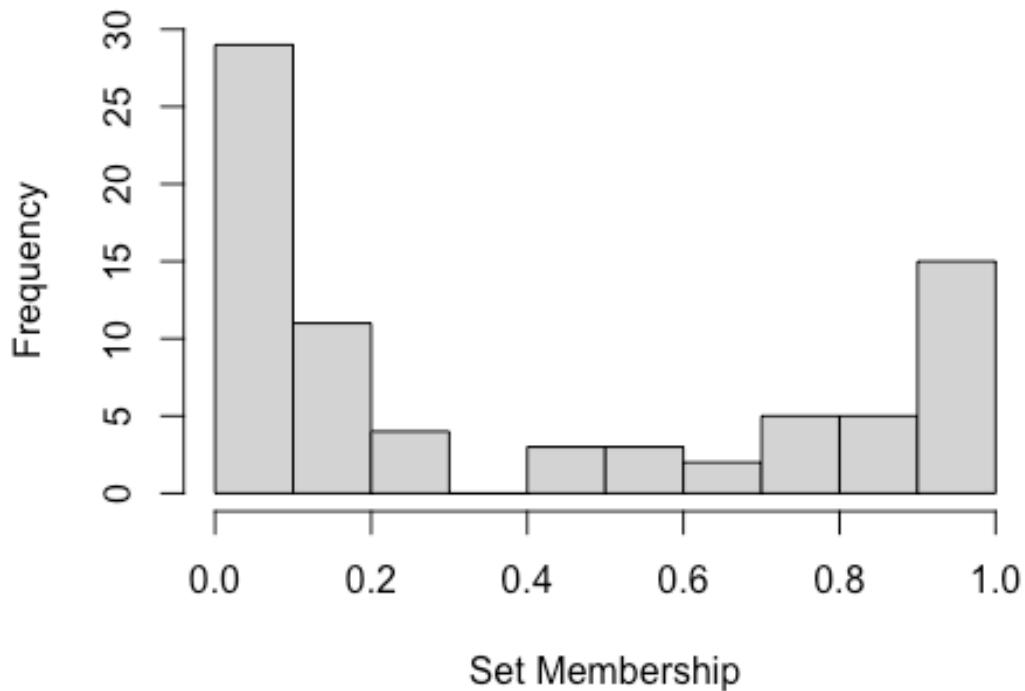

**UN**

**EP**

**LM**

```
[1] "Set LPI - Cases > 0.5 / Total number of cases: 54 / 77 = 70.13 %"  
[2] "Set WC - Cases > 0.5 / Total number of cases: 29 / 77 = 37.66 %"  
[3] "Set UN - Cases > 0.5 / Total number of cases: 38 / 77 = 49.35 %"  
[4] "Set EP - Cases > 0.5 / Total number of cases: 43 / 77 = 55.84 %"  
[5] "Set LM - Cases > 0.5 / Total number of cases: 30 / 77 = 38.96 %"
```

```
# ambiguous cases  
ambig.cases(MACRO.d)  
  
  row col  
BG05   5   4  
  
# BG05 in high employment protection
```

No single set is too skewed. Bulgaria in 2005 holds a membership of 0.5 in condition high employment protection.

## 1.2 Analysis of sufficiency, outcome *LPI*

In a first step, we produce a truth table.

```
# truth table  
tt_y <- truthTable(data = MACRO.d,  
                     outcome = 'LPI',
```

```

conditions = conds,
incl.cut = 0.8,
sort.by = c('OUT', 'incl'),
complete = TRUE,
show.cases = TRUE)
tt_y

OUT: output value
n: number of cases in configuration
incl: sufficiency inclusion score
PRI: proportional reduction in inconsistency

      WC UN EP LM   OUT    n  incl  PRI
4     0  0  1  1     1     4  0.911 0.871
8     0  1  1  1     1     5  0.900 0.833
12    1  0  1  1     1     7  0.873 0.839

# Sufficiency Plot

Cons.Suf: 0.839; Cov.Suf: 0.598; PRI: 0.804

We establish each case's membership in *supportive welfare regimes* by intersecting their membership scores in the conjunctions  $LM * WC$  and  $LM * EP$ . We then display the result in an XY plot. It corresponds to the one shown as figure 1.2 in the book.

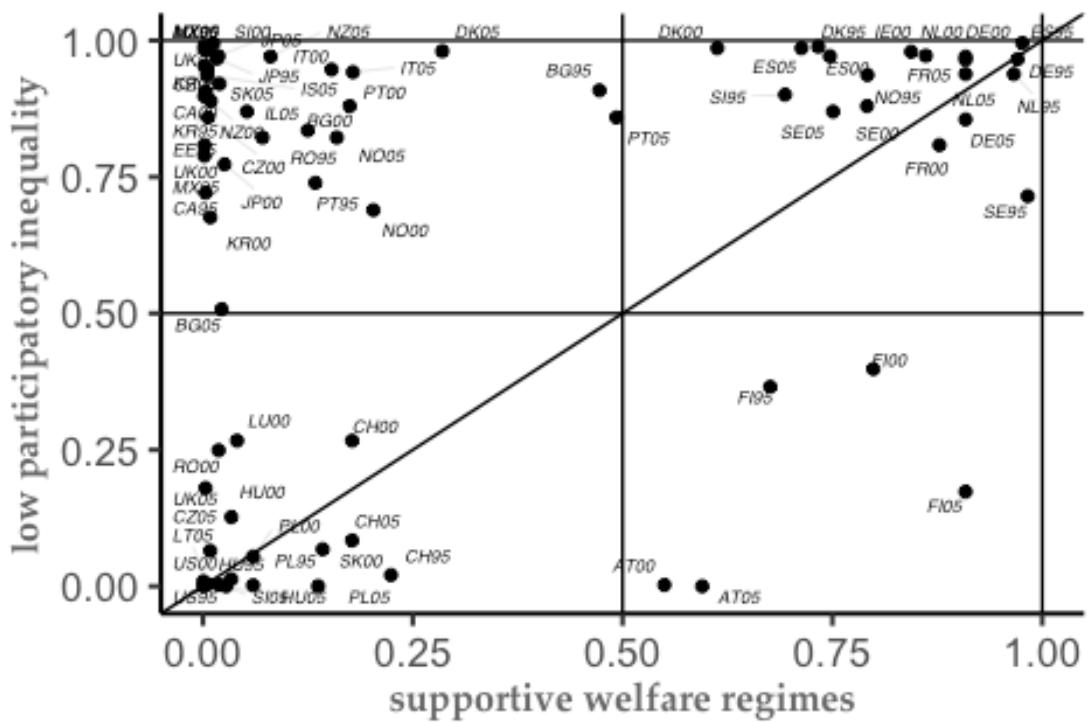

```
# create XY plot for supportive welfare regime LM(WC+EP)
MACRO.d$SUP1 <- with(MACRO.d, fuzzyor(WC, EP))

MACRO.d$SUPPORT <- with(MACRO.d, fuzzyand(LM, SUP1))

xy.plot(data = MACRO.d,
         x = 'SUPPORT',
         y = 'LPI',
         xlab = 'supportive welfare regimes',
         ylab = 'low participatory inequality',
         fontsize = 2,
         jitter = TRUE)
```

# XY plot

Cons.Suf: 0.844; Cov.Suf: 0.391; PRI: 0.809

## 2 Chapter 2: Vis (2009)

In chapter 2, I use the example by Vis (2009). The solution formula consists of a single set. We can therefore postpone all those challenges for SMMR that arise from disjunctions (equifinality) and conjunctions (conjunctural causation).

*Outcome*

- $U = \text{Unpopular welfare state reforms}$

*Conditions*

- $P = \text{Weak political position}$
- $S = \text{Weak socio-economic position}$
- $R = \text{Right-leaning government}$

I start by producing the solution formula and then turn first to single-case and then to comparative-case SMMR designs.

### 2.1 Producing the solution formula

We begin by loading the data

```
VIS_fs <- read.csv("Vis_09_fs.csv", row.names = 1)
VIS_fs
```

	P	S	R	U
Lubbers1	0.33	0.83	1.00	0.83
Lubbers2	0.17	0.33	1.00	0.33
Lubbers3	0.33	0.67	0.60	0.67

Thatcher2	0.33	0.33	1.00	0.67
Thatcher3	0.33	0.67	1.00	0.67

```

Major1      0.33 0.60 1.00 0.67
Blair1     0.17 0.33 0.00 0.40
Blair2     0.33 0.33 0.00 0.33

tt_fy <- truthTable(data = VIS_fs,
                      outcome = "U",
                      conditions = "P, S, R",
                      incl.cut = 0.8,
                      sort.by = "incl",
                      complete = TRUE)
tt_fy

OUT: output value
n: number of cases in configuration
incl: sufficiency inclusion score
PRI: proportional reduction in inconsistency

      P   S   R    OUT      n  incl   PRI
4    0   1   1      1      7  0.918  0.782
7    1   1   0      1      2  0.911  0.773
8    1   1   1      1      3  0.911  0.647
2    0   0   1      0      6  0.719  0.242
1    0   0   0      0      7  0.642  0.307
3    0   1   0      ?      0   -     -
5    1   0   0      ?      0   -     -
6    1   0   1      ?      0   -     -

```

Based on this truth table, we obtain the following most parsimonious solution formula.

```

sol_fyp <- minimize(tt_fy,
                      include = "?",
                      details = TRUE)
sol_fyp

M1: S -> U

      inclS    PRI    covS    covU
-----
1    S  0.901  0.787  0.878  -
-----
M1  0.901  0.787  0.878

```

The single condition ‘socio-economic trouble’  $S$  is found to be sufficient for outcome ‘unpopular reforms  $U$ .

The solution can be visualized with an XY plot.

```

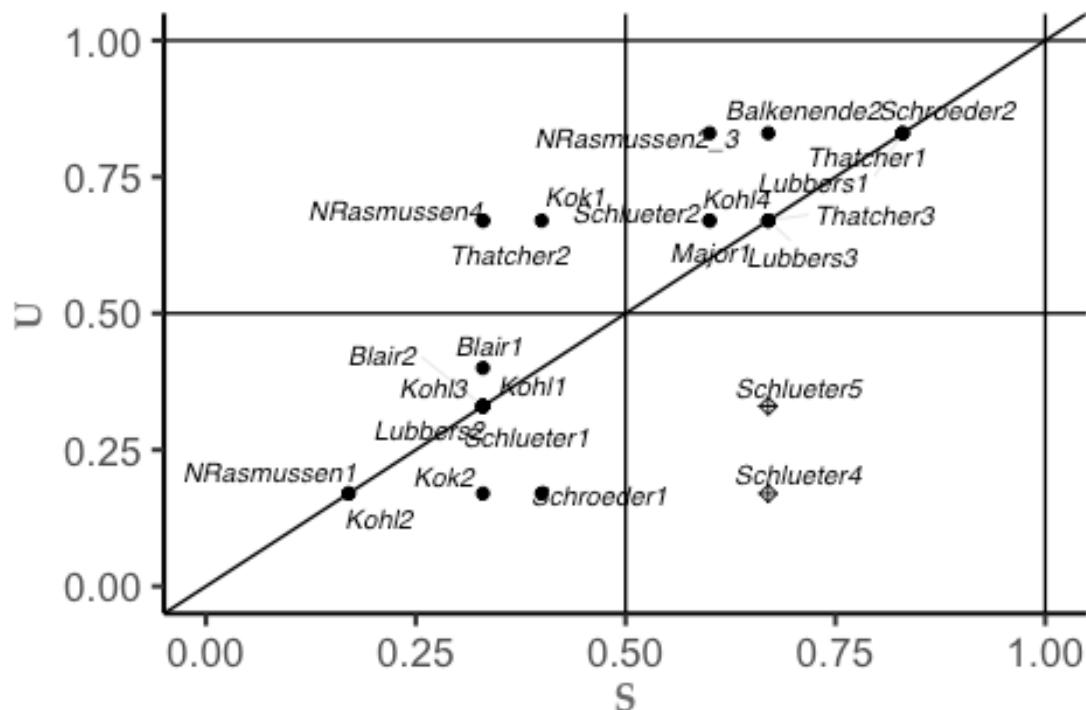

pimplot(data = VIS_fs,
        outcome = "U",

```

```
results = sol_fyp,  
jitter = TRUE,  
all_labels = TRUE)
```

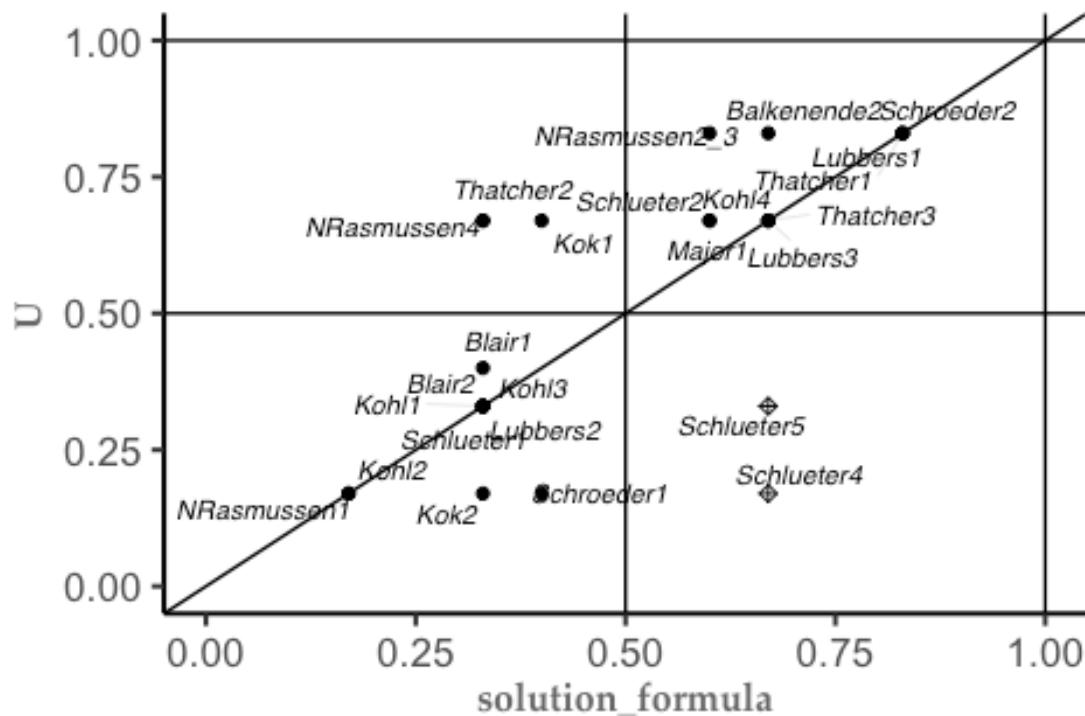

# Sufficiency Plot

Cons.Suf: 0.901; Cov.Suf: 0.878; PRI: 0.787

# Sufficiency Plot

Cons.Suf: 0.901; Cov.Suf: 0.878; PRI: 0.787

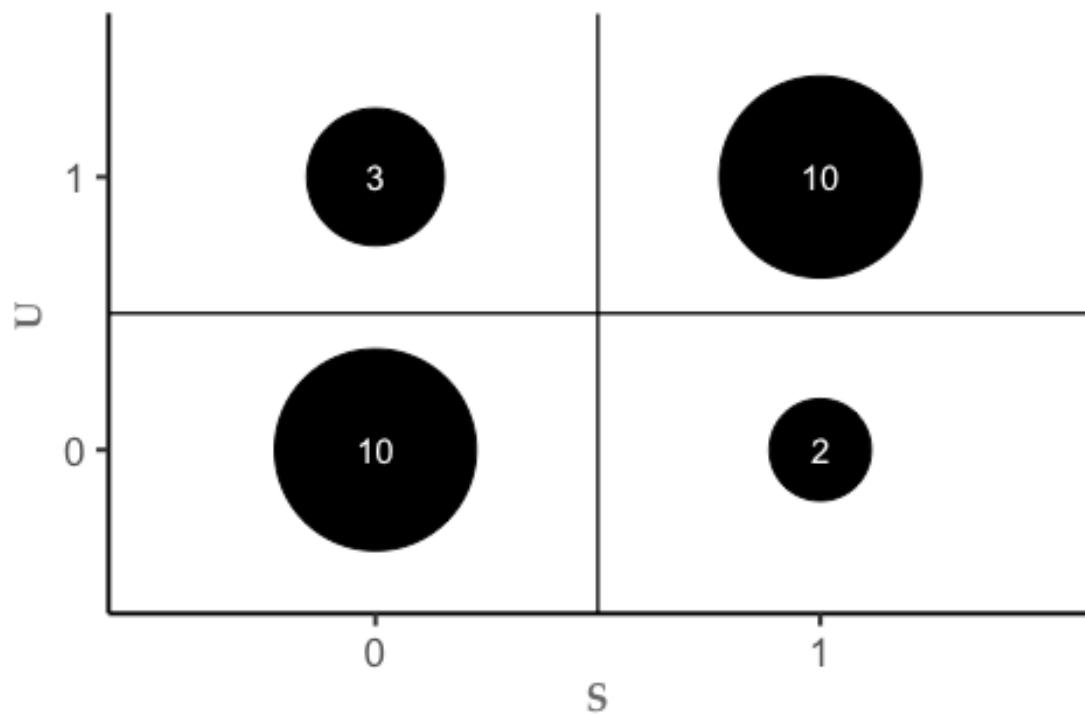

If the data was crisp, we could also use the `pimplot()` command and add the argument `crisp = TRUE`.

```
pimplot(data = VIS_fs,
        outcome = "U",
        results = sol_fyp,
        jitter = TRUE,
        all_labels = TRUE,
        crisp = TRUE)
```

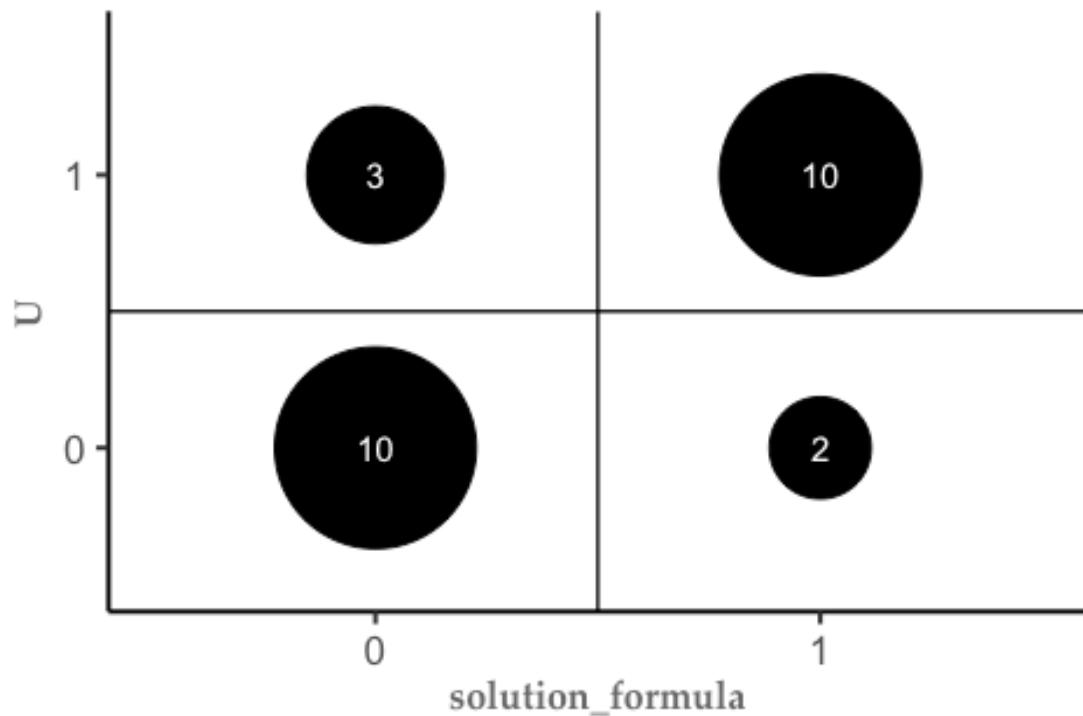

# Sufficiency Plot

Cons.Suf: 0.901; Cov.Suf: 0.878; PRI: 0.787

# Sufficiency Plot

Cons.Suf: 0.901; Cov.Suf: 0.878; PRI: 0.787

## 2.2 Single-case SMMR designs

There are two model-refining single-case designs: the study of a deviant coverage case for identifying a missing disjunct, on the one hand, and the study of a deviant consistency case for identifying a missing conjunct.

```
dcov <- smmr(results = sol_fyp,
               outcome = "U",
               match = FALSE,
               cases = 4)
dcov

Deviant Coverage Cases :
-----
   Case Sol TT_P TT_S TT_R TT_row Outcome TT<=Y Best MostDCOV
2 NRasmussen4 0.33    0    0    0   0.67    0.67 TRUE  0.33    TRUE
1 Kok1        0.40    0    0    0   0.60    0.67 TRUE  0.40    FALSE
3 Thatcher2  0.33    0    0    1   0.67    0.67 TRUE  0.33    TRUE

dcons <- smmr(results = sol_fyp,
                outcome = "U",
                match = FALSE,
```

```

            cases = 3)
dcons

Deviant Consistency Cases :
-----
      Cases Term TermMemb Outcome Best MostDCONS
1 Schlueter4   S    0.67    0.17  0.83     TRUE
2 Schlueter5   S    0.67    0.33  0.99    FALSE

```

For causal inference SMMR designs, one option exists: the study of a typical case.

```

typ_term <- smmr(results = sol_fyp,
                   outcome = "U",
                   match = FALSE,
                   cases = 1)
typ_term

```

Typical Cases :

```

-----
      Case Term TermMemb Outcome UniqCov Best MostTyp
1 Lubbers1   S    0.83    0.83  TRUE  0.17  TRUE
5 Schroeder2 S    0.83    0.83  TRUE  0.17  TRUE
8 Thatcher1  S    0.83    0.83  TRUE  0.17  TRUE
2 Lubbers3   S    0.67    0.67  TRUE  0.33  FALSE
4 Kohl4      S    0.67    0.67  TRUE  0.33  FALSE
9 Thatcher3  S    0.67    0.67  TRUE  0.33  FALSE
6 Schlueter2 S    0.60    0.67  TRUE  0.54  FALSE
10 Major1    S    0.60    0.67  TRUE  0.54  FALSE
3 Balkenende2 S    0.67    0.83  TRUE  0.65  FALSE
7 NRasmussen2_3 S    0.60    0.83  TRUE  0.86  FALSE

```

## 2.3 Comparative-case SMMR designs

There are two comparative-case descriptive inference SMMR designs. The first matches deviant coverage cases with iir cases with the goal of identifying missing disjuncts.

```

dcoviir <- smmr(results = sol_fyp,
                   outcome = "U",
                   match = TRUE,
                   cases = 4)
dcoviir

```

Matching Deviant Coverage-IIR Cases :

```

-----
      DCOV          IIR TT_P TT_S TT_R TT_DCV<=Y Best
1 Kok1 Schroeder1  0   0   0   TRUE  1.30
2 Kok1 Kok2        0   0   0   TRUE  1.30
3 Kok1 NRasmussen1 0   0   0   TRUE  1.30
4 NRasmussen4 Kok2  0   0   0   TRUE  1.30
5 NRasmussen4 NRasmussen1 0   0   0   TRUE  1.30
6 Thatcher2 Kohl2   0   0   1   TRUE  1.16

```

7	Thatcher2	Lubbers2	0	0	1	TRUE	1.32
8	Thatcher2	Kohl3	0	0	1	TRUE	1.32
9	Thatcher2	Kohl1	0	0	1	TRUE	1.32
10	Thatcher2	Schlueter1	0	0	1	TRUE	1.32

The second design matches typical cases with deviant consistency cases with the goal of identifying missing conjuncts.

```
typdcons <- smmr(results = sol_fyp,
                  outcome = "U",
                  match = TRUE,
                  cases = 3)
typdcons

Term S :
-----
      TYP      DCONS Best MostTypTerm MostDCONS
1 Lubbers1 Schlueter4 1.00      TRUE      TRUE
3 Schroeder2 Schlueter4 1.00      TRUE      TRUE
4 Thatcher1 Schlueter4 1.00      TRUE      TRUE
2 Balkenende2 Schlueter4 1.00     FALSE      TRUE
5 NRasmussen2_3 Schlueter4 1.14     FALSE      TRUE
```

For causal inference, there are two comparative-case SMMR designs. The first matches typical cases with iir cases.

```
typiir_term <- smmr(results = sol_fyp,

### 3 Chapter 3: Stevens (2016)

In chapter 3, the study by Stevens (2016) on corruption perception is used to illustrate how SMMR works in the presence of disjunctions (without conjunctions).

*Outcome*

- HC = High perceived corruption

*Conditions*

- LD = Low democracy
- HR = High rational secular orientation
- HS = High self expression orientation
- LH = Low human development
- HI = High income inequality

To bring to the fore the challenges and the solutions provided, I do alter the data by Stevens (2016) in several regards and as outlined in the following code.

```
# Get original data and manipulate to produce altered data set #####
STEVENS <- read.csv(file = 'Stevens_16_fs.csv',
                     sep = ';',
                     dec = ',',
                     row.names = 1)

STEVENS$D <- 1-STEVENS$D # invert scale so that the presence of condition
# appears in sol
STEVENS$H <- 1-STEVENS$H # invert scale so that the presence of condition
# appears in sol

# turn set Labels from one-letter to two letter
names(STEVENS) <- c("LD", "HR", "HS", "LH", "HI", "HC")

# recalibrate specific cases to have more deviant cases consistency
STEVENS['Jordan',1] <- 0.7
STEVENS['Georgia',1] <- 0.6
STEVENS['Kazakhstan',1] <- 0.95
STEVENS['Ethiopia',1] <- 0.83
STEVENS['Belarus',1] <- 0.9
STEVENS['Vietnam',1] <- 0.85
STEVENS['Pakistan',4] <- 0.9
STEVENS['Tanzania',4] <- 0.89
STEVENS['Morocco',4] <- 0.62
STEVENS['Rwanda',4] <- 0.903
```

```
write.csv(STEVENS, file = 'Stevens_16_fs_altered.csv')
```

With the altered data set, I first produce the truth table and the most parsimonious solution, which is also visualized via XY plots.

```
STEV <- read.csv('Stevens_16_fs_altered.csv', row.names = 1)
```

```
# object containing the condition labels
conds <- c("LD", "HR", "HS", "LH", "HI")
```

```
# truth table
TT_y <- truthTable(data = STEV,
                     outcome = 'HC',
                     conditions = conds,
                     incl.cut = 0.85,
                     show.cases = TRUE,
                     n.cut = 2,
                     sort.by = c('OUT', 'incl'),
                     complete = TRUE)
```

```
TT_y
```

```
OUT: output value
n: number of cases in configuration
incl: sufficiency inclusion score
PRI: proportional reduction in inconsistency
```

## 4 Chapter 4: Haesebrouck and Van Immerseel (2020)

In chapter 4, I discuss the challenges for SMMR that arise from the presence of conjunctions (without disjunctions). For this, I use the example by Haesebrouck and Van Immerseel (2020) on decisions to deploy military abroad.

### *Outcome*

- $\sim PC$  = No political contestation

### *Conditions*

- PD = Not potentially divisive operation (PD)
- HR = High risk operation
- PI = Parliament involved
- PF = Parliament fractionalized
- RO = Right opposition
- GS = Government strong
- GP = Government polarized

Just as in the previous chapter, also in this example, I alter the data slightly such that the challenges to SMMR triggered by conjunctions are brought to the fore. The following code provides the details of the changes to the data.

```
# Adjusting data for didactical purposes
HAES.d <- read.csv('data_fs.csv', row.names = 1)

HAES.d['ITA_Alba', 5] <- 0.8
HAES.d['FRN_Sangaris', 5] <- 0.885
HAES.d['FRN_DaeshIr', 5] <- 0.9
HAES.d['SLK_EUMali', 5] <- 0.93
HAES.d['SLK_Sophia', 1] <- 0.87
HAES.d['DK_Kosovo', 1] <- 0.6

HAES.d['BEL_DaeshIr', 4] <- 0.1
HAES.d['DK_Serval', 4] <- 0.01
HAES.d['FRN_Serval', 4] <- 0.02

HAES.d$PD <- 1 - HAES.d$PD

write.csv(HAES.d, "HaesebrouckImmerseel_20_data_fs_altered.csv")

HAES.data <- read.csv('HaesebrouckImmerseel_20_data_fs_altered.csv',
row.names = 1)
```

I produce the truth table, the most parsimonious solution, and the XY plots for this solution

```
# truth table
TT_yn <- truthTable(data = HAES.data, outcome = "~PC",
                      conditions = c("PD", "HR", "PI", "PF", "RO", "GP"),
                      incl.cut = 0.75,
                      show.cases = TRUE,
                      complete = FALSE,
                      sort.by = c("OUT", "incl"))
```

TT\_yn

```
OUT: output value
n: number of cases in configuration
incl: sufficiency inclusion score
PRI: proportional reduction in inconsistency

## 4.2 Causal inference SMMR

The presence of conjuncts requires researchers to make a choice when aiming at causal inferences: do they want to solicit conceptual arguments and treat the conjunction as one set or do they want to treat each conjunct in the conjunction separately. The latter is the default options. The following code implements the three SMMR designs that operate on focal conjuncts.

```

# typical
typ_foc <- smmr(results = sol_nyp,
                  outcome = "~PC",
                  match = FALSE,
                  cases = 2)
typ_foc

```

### 4.3 Chapter 4: M. R. Schneider, Schulze-Bentrop, and Paunescu (2010), necessary INUS condition

Sometimes, INUS conditions qualify as necessary conditions for the outcome. This must be taken into account in all causal inference SMMR designs that zoom in on the necessary focal conjunct. This is done by specifying the necessary INUS condition via the argument

`nec.cond` = in function `smmr()`. For illustration I use the study by M. R. Schneider, Schulze-Bentrop, and Paunescu (2010).

### Outcome

- EXPORT = success in export of high-tech products

### Conditions

- EMP= high employment protection
- BARGAIN = high collective bargaining
- UNI = a lot of university training
- OCCUP = a lot of occupational training
- STOCK = big stock market size
- MA = a lot of mergers and acquisitions

```
SCHF <- read.csv("Schneider_eta_10_fs.csv", row.names = 1)
```

We identify the necessary condition *STOCK* and visualize it in an XY plot.

```
# Identify necessary condition
NEC <- superSubset(SCHF, outcome = "EXPORT",
                     conditions = c("EMP", "BARGAIN", "UNI", "OCCUP", "STOCK", "MA"),
                     incl.cut = .87,
                     ron.cut = 0.5,
                     cov.cut = 0.6,
                     depth = 1)
```

```
NEC
```

	inclN	RoN	covN
1 STOCK	0.891	0.628	0.719

```
# Plot necessary condition
```

```
pimplot(SCHF,
         results = NEC,
         outcome = "EXPORT",
         necessity = TRUE)
```

# Necessity Plot

Cons.Nec: 0.891; Cov.Nec: 0.719; RoN: 0.628

In the next step, we identify the sufficient conditions. For this, we first produce the truth table. Since we do have a necessary condition, we must make sure that our sufficiency statements do not contradict this necessity claim. For this, we apply the Enhanced Standard Analysis (ESA). This means, we must block from being included in the logical minimization all those truth table rows that would contradict the necessity claim.

```
# Obtain truth table
TT_y <- truthTable(SCHF, outcome = "EXPORT",
                     conditions = c("EMP", "BARGAIN", "UNI", "OCCUP", "STOCK",
"MA"),
                     incl.cut = .9,
                     pri.cut = 0.5,
                     sort.by =c('OUT', 'incl'))
TT_y
```

OUT: output value  
n: number of cases in configuration  
incl: sufficiency inclusion score  
PRI: proportional reduction in inconsistency

The logical minimization produces two enhanced most parsimonious solutions (aka model ambiguity). For illustration I focus on model 1. The insights and arguments on SMMR that follow remain unaffected by the presence of model ambiguity and the choice of model 1 for illustration.

```
# Logically minimize the enhanced truth table to obtain the enhanced most
parsimonious solution
sol_yp <- minimize(TT_yesa,
                     include = "?",
                     details = TRUE, show.cases = TRUE)

sol_yp
```

The empirical illustration consists of the three causal inference SMMR designs because only for them the focal conjunct principle applies. I illustrate using term 3 ( $\sim OCCUP * STOCK * \sim MA$ ).

The best available typical case is found as follows. Note that argument nec.cond = specifies *STOCK* as the necessary INUS condition.

```
# Best available typical case
typ_foc <- smmr(results = sol_yp,
  outcome = "EXPORT",
  match=FALSE,
  cases=2,
  term = 3,
```

```

nec.cond = "STOCK")
typ_foc

## 5 Chapter 5: C. Q. Schneider and Makszin (2014)

In chapter 5, the example of C. Q. Schneider and Makszin (2014) is used for empirically illustrating different scenarios on the location of a case's membership in the within-case mechanism vis-a-vis its membership in the cross-case conditions and the outcome in a setting of full causal complexity (that is, a QCA solution that consists of a disjunction of conjunctions).

I start with model-refining, descriptive inference SMMR and then turn to causal inference SMMR.

```
MACRO.d <- read.csv('SchneiderMakszin2014.csv', row.names = 1)
```

```
# conditions
conds <- c("WC", "UN", "EP", "LM")

# truth table
tt_y <- truthTable(data = MACRO.d,
                     outcome = 'LPI',
                     conditions = conds,
                     incl.cut = 0.8,
                     sort.by = c('OUT', 'incl'),
                     complete = TRUE,
                     show.cases = TRUE)

tt_y

Eight truth table rows populated by deviant coverage cases. This signals high heterogeneity in data - something also illustrated by fact that there is just one remainder row (see truth table in chapter 1 ???). Another interesting observation: truth table row 2 (0001) has only deviant coverage case (NZ00) but no iir case. Why is the row not consistent enough to be included in the logical minimization? Let's plot it.

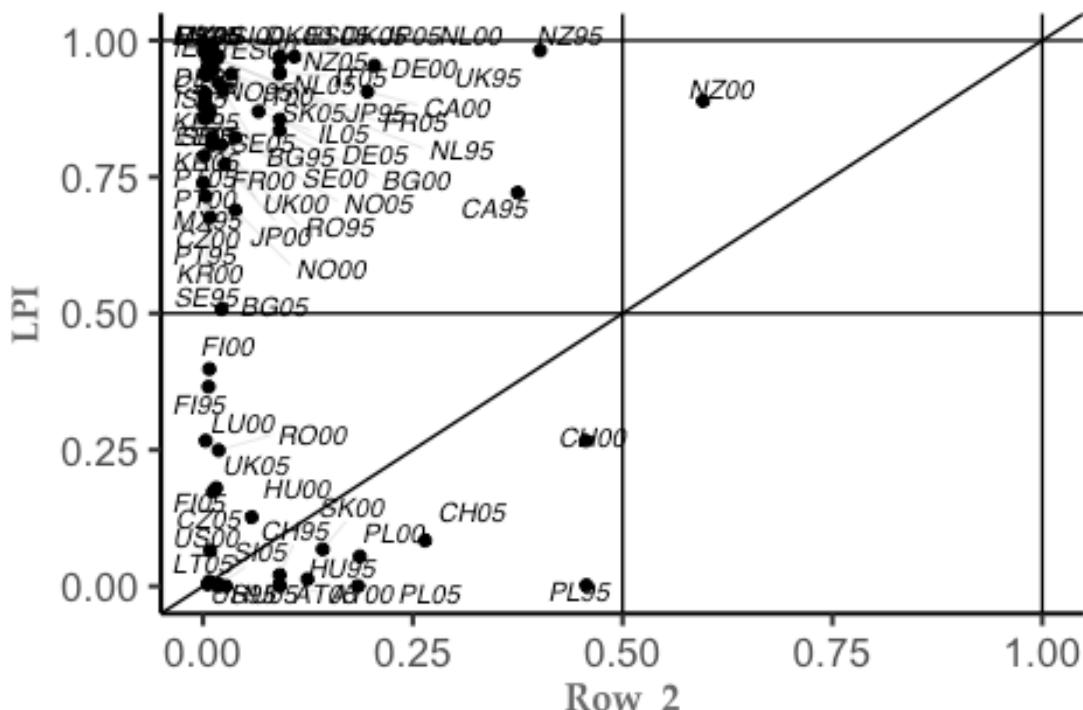

```

pimplot(data = MACRO.d,
        outcome = 'LPI',
        ttrows = c(2),
        results = sol_yp,
        all_labels = TRUE,
        jitter = TRUE,
        consH = TRUE)

```

# Sufficiency Plot

Cons.Suf: 0.686; Cov.Suf: 0.071; PRI: 0.476; Cons.Suf(H): 0.658

The low consistency (.686) seems to be driven down by iir cases AND by skewed membership: with most cases being ttrow2 = 0, the few cases that are >0 have relatively more weight in the consistency formula.

Pairs of deviant coverage and iir cases:

```
dcov_iir <- smmr(results = sol_yp,
                    outcome = 'LPI',
                    match = TRUE,
                    cases = 4)
```

dcov\_iir

There are pairs of deviant coverage and iir cases in seven truth table rows (all but 0001 with NZ00).

## 5.1 Descriptive inference SMMR

For identifying missing conjuncts, we need to select among deviant consistency cases, either alone or in comparision with a typical case.

```
dcons <- smmr(results = sol_yp,
               outcome = 'LPI',
               match = FALSE,
               cases = 3)
dcons

Deviant Consistency Cases :
-----
   Cases Term TermMemb Outcome Best MostDCONS
21  LT05 ~UN*EP    0.939  0.003 0.125      TRUE
11  AT05 ~UN*EP    0.546  0.000 0.908     FALSE
12  AT00 EP*LM     0.550  0.003 0.903      TRUE
22  AT05 EP*LM     0.546  0.000 0.908     FALSE
31  FI95 EP*LM     0.676  0.366 1.014     FALSE
5   FI05 EP*LM     0.523  0.173 1.127     FALSE
41  FI00 EP*LM     0.602  0.398 1.194     FALSE
4   FI05 WC*LM     0.909  0.173 0.356      TRUE
3   FI00 WC*LM     0.799  0.398 0.801     FALSE
2   AT05 WC*LM     0.595  0.000 0.810     FALSE
1   AT00 WC*LM     0.550  0.003 0.903     FALSE
```

Case AT05 deviates in all 3 sufficient terms (and AT00 in 2 of them). This might indicate an idiosyncratic reason? For instance, membership in the outcome of AT00 and AT05 could be assigned erroneously (e.g. typo in the data).

Comparing deviant consistency and typical cases, we obtain the following list of best-available pairs:

```
typdcons <- smmr(results = sol_yp,
                    outcome = 'LPI',
                    match = TRUE,
                    cases = 3)
typdcons

Term WC*LM :
-----
  TYP DCONS Best MostTypTerm MostDCONS
1 NL00 FI05 0.385 FALSE TRUE
2 DE95 FI05 0.390 FALSE TRUE
3 DE00 FI05 0.391 FALSE TRUE
4 NL95 FI05 0.417 TRUE TRUE
5 NL05 FI05 0.417 TRUE TRUE

Term ~UN*EP :
-----
  TYP DCONS Best MostTypTerm MostDCONS
1 ES95 LT05 0.130 FALSE TRUE
2 MX05 LT05 0.136 FALSE TRUE
3 ES05 LT05 0.139 FALSE TRUE
4 MX00 LT05 0.142 FALSE TRUE
5 ES00 LT05 0.154 TRUE TRUE

Term EP*LM :
-----
  TYP DCONS Best MostTypTerm MostDCONS
1 ES95 AT00 0.907 TRUE TRUE
2 ES95 AT05 0.913 TRUE FALSE
3 DK95 AT00 0.914 FALSE TRUE
4 ES05 AT00 0.917 FALSE TRUE
5 DK95 AT05 0.920 FALSE FALSE
```

Note that only for one out of three terms do the most typical and most deviant pair also form the best available pair (ES95-AT00 for term *EP \* LM*).

## 5.2 Causal inference SMMR

### 5.2.1 Single-case designs

All causal inference SMMR designs involve at least one typical case. Let's start with the single typical case SMMR design. Two options exist: either we focus on the entire term or on each conjunct in a term.

```

typ_term <- smmr(results = sol_yp,
                  outcome = 'LPI',
                  match = FALSE,
                  cases = 1)
typ_term

Typical Cases :
-----

```

	Case	Term	TermMemb	Outcome	UniqCov	Best	MostTyp

2	DE95	WC*LM	0.9086748	0.9657468	TRUE	0.20546926	FALSE
4	IE00	WC*LM	0.8438186	0.9793647	TRUE	0.42727353	FALSE
1	DK00	WC*LM	0.6128984	0.9860489	TRUE	1.13340252	FALSE
5	NL95	WC*LM	0.9086748	0.9385688	FALSE	0.15111329	TRUE
7	NL05	WC*LM	0.9086748	0.9385688	FALSE	0.15111329	TRUE
3	DE00	WC*LM	0.9086748	0.9647188	FALSE	0.20341334	FALSE
6	NL00	WC*LM	0.9086748	0.9704676	FALSE	0.21491101	FALSE
8	NO95	WC*LM	0.7917734	0.9367786	FALSE	0.49823702	FALSE
9	ES05	WC*LM	0.7131751	0.9860489	FALSE	0.83257252	FALSE

Focusing on the entire term is recommended only if there are theoretical and conceptual reasons to treat the term as one set. Short of this, each conjunct needs to be focussed on separately for causal inference.

```

typ_foc1 <- smmr(results = sol_yp,
                   outcome = 'LPI',
                   match = FALSE,
                   cases = 2,
                   term = 1)

For all three terms and all conjuncts, close to ideal cases can be selected: uniquely covered, rank 1, consistent FC. Note that rarely are they the most typical for the term or FC, though, which is not a problem as such.

### 5.2.2 Comparative-case designs

To obtain the best available pairs of typical and iir cases when treating a conjunction as one set, the following command needs to be run.

```
typ_iir_term <- smmr(results = sol_yp,
                      outcome = 'LPI',
                      match = TRUE,
                      cases = 6,
                      max_pairs = 50)
typ_iir_term

We see that for each term, several pairs tick the important boxes of UniqCov and GlobUncov.

Matching two typical cases when treating the conjunction as one set, generates the following results:

```
typ_typ_term <- smmr(results = sol_yp,
                      outcome = 'LPI',
                      match = TRUE,
                      cases = 5,
```

```

max_pairs = 50)
typ_typ_term

For each of the three terms, pairs of uniquely covered typical cases can be found.

In the book I do not treat each conjunct as one set and, instead, apply the focal conjunct principle. I discuss only two of the three conjunctions: *LM \* WC* and *LM \* EP*. Let's start with *LM \* WC*.

```
typ_typ_foc1 <- smmr(results = sol_yp,
                        outcome = 'LPI',
                        match = TRUE,
                        cases = 1,
                        term = 1,
                        max_pairs = 50)
typ_typ_foc1
```

For focal conjunct *WC*: only one pair with both typical cases uniquely covered (DE95-DK00)

For focal conjunct *LM*: only pair in rank 2 with both uniquely covered (IE00 - DK00), but DK00 has inconsistent focal conjunct.

```
typ_typ_foc3 <- smmr(results = sol_yp,

For focal conjunct *EP* several pairs are fine (all involving case SE). The best-available pair even matches SE00 to SE05.

For focal conjunct *LM* only one pair from rank 1 with both uniquely covered and consistent focal conjuncts exists (FR0 - SI95).

### 5.3 Illustrating mechanisms

In the book, I empirically illustrate the location of the mechanism *M* vis-a-vis the two conjunctions *LM* \* *WC* and *LM* \* *EP*. More often than not, data on the best-available pairs of typical and iir cases is not available and therefore the next best-available case pairs need

to be chosen. The following lines of command produce the graphs depicted in chapter 5 involving membership scores of cases in the mechanism.

```
MECH <- read.csv('micro_macro_best.csv', row.names = 1)
```

Let's start with term  $LM * WC$  and there with focal conjunct  $WC$ .

```
MECH_test <- subset(MECH,
                      MECH$ID_mac %in%
                        c('DE95', 'PL95'))

with(MECH_test, plot(WC,LPI,
                      pch = 16, cex = .7,
                      xlim = c(0,1),
                      ylim = c(0,1),
                      xlab = "cross-case focal conjunct WC and within-case
mechanisms"))
text(MECH_test$WC, MECH_test$LPI, labels = MECH_test$ID_mac,
      cex = 0.7, pos = 3)
legend(x = 0.5, y = 0.5, # "bottomright",
       # Add Legend to plot
       legend = c("WC", "lodif_repres", "lodif_poleff"),
       pch = c(16, 0, 1),
       cex = 0.5
)

abline(h=0.5, col="black")
abline(v=0.5, col="black")
abline(coef = c(0,1))

with(MECH_test, points(MECH_test$lorepres_diff,LPI,
                      pch = 0, cex = .7))
with(MECH_test, points(MECH_test$lopoleff_diff,LPI,
                      pch = 1, cex = .7))
```

And now focal conjunct  $LM$  in conjunction  $LM * WC$

```
# get only two relevant cases
MECH_test <- subset(MECH,
                      MECH$ID_mac %in%
                        c('IE00', 'HU00'))

{with(MECH_test, plot(LM,LPI,
                      pch = 16, cex = .7,
                      xlim = c(0,1),
                      ylim = c(0,1),
                      xlab = "cross-case focal conjunct LM and within-case
mechanisms"))}
```

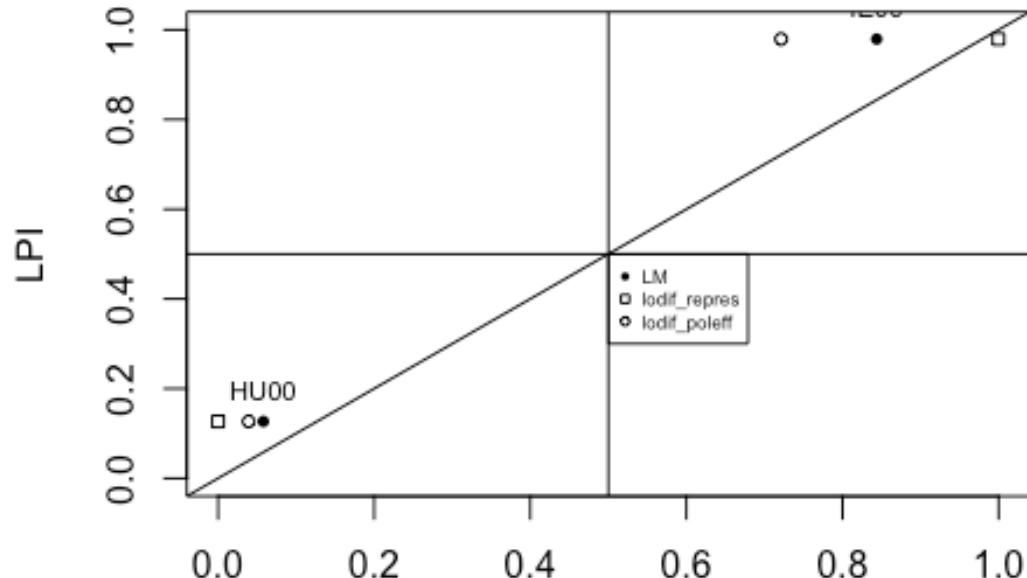

```

text(MECH_test$LM, MECH_test$LPI, labels = MECH_test$ID_mac,
  cex = 0.7, pos = 3)
legend(x = 0.5, y = 0.5, # "bottomright",
  # Add Legend to plot
  legend = c("LM", "lodif_repres", "lodif_poleff"),
  pch = c(16, 0, 1),
  cex = 0.5
)

abline(h=0.5, col="black")
abline(v=0.5, col="black")
abline(coef = c(0,1))

with(MECH_test, points(MECH_test$lorepres_diff,LPI,
  pch = 0, cex = .7))
with(MECH_test, points(MECH_test$lopoleff_diff,LPI,
  pch = 1, cex = .7))}

```

cross-case focal conjunct LM and within-case mechanisms

Turning to conjunction  $LM * EP$ , let's focus first on conjunct  $LM$ .

```

MECH_test <- subset(MECH,
  MECH$ID_mac %in%
  c('FR05', 'R000'))

```

```

with(MECH_test, plot(LM,LPI,
                     pch = 16, cex = .7,
                     xlim = c(0,1),
                     ylim = c(0,1),
                     xlab = "cross-case focal conjunct LM and within-case
mechanisms"))
text(MECH_test$LM, MECH_test$LPI, labels = MECH_test$ID_mac,
      cex = 0.7, pos = 3)
legend(x = 0.5, y = 0.5, # "bottomright",
       # Add legend to plot
       legend = c("LM", "lodif_repres", "lodif_poleff"),
       pch = c(16, 0, 1),
       cex = 0.5
)
abline(h=0.5, col="black")
abline(v=0.5, col="black")
abline(coef = c(0,1))

with(MECH_test, points(MECH_test$lorepres_diff,LPI,
                      pch = 0, cex = .7))
with(MECH_test, points(MECH_test$lopoleff_diff,LPI,
                      pch = 1, cex = .7))

```

And finally, focal conjunct *EP*.

```

# term LM*EP focal conjunct EP < Y: SE05 - HU00

MECH_test <- subset(MECH,
                     MECH$ID_mac %in%
                     c('SE05', 'HU00'))

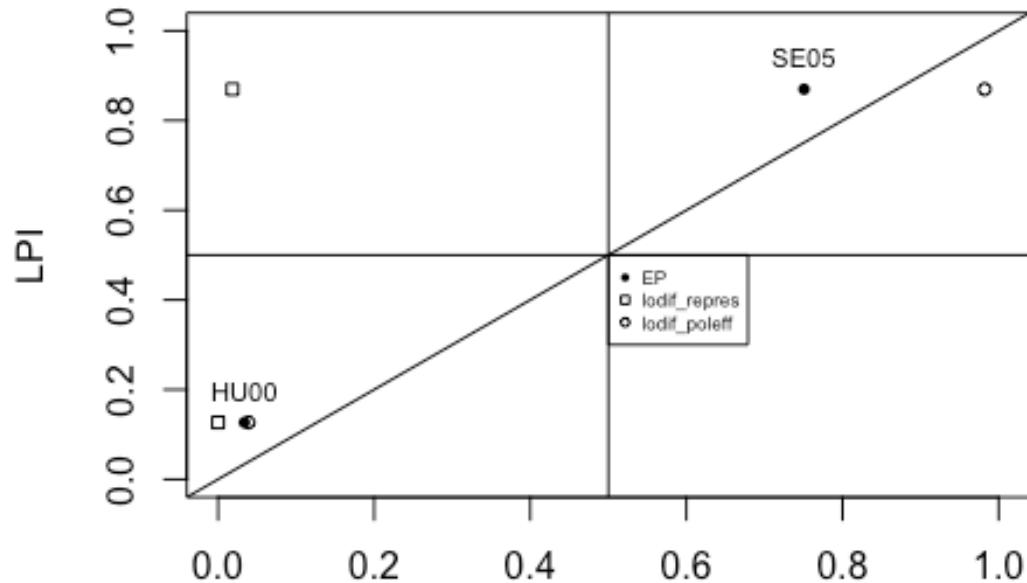

with(MECH_test, plot(EP,LPI,
                     pch = 16, cex = .7,
                     xlim = c(0,1),
                     ylim = c(0,1),
                     xlab = "cross-case focal conjunct EP and within-case
mechanisms"))
text(MECH_test$EP, MECH_test$LPI, labels = MECH_test$ID_mac,
      cex = 0.7, pos = 3)
legend(x = 0.5, y = 0.5, # "bottomright",
       # Add legend to plot
       legend = c("EP", "lodif_repres", "lodif_poleff"),
       pch = c(16, 0, 1),
       cex = 0.5
)
```

```

# plot the mechanism dots
abline(h=0.5, col="black")
abline(v=0.5, col="black")
abline(coef = c(0,1))

with(MECH_test, points(MECH_test$lorepres_diff,LPI,
                      pch = 0, cex = .7))
with(MECH_test, points(MECH_test$lopoleff_diff,LPI,
                      pch = 1, cex = .7))

```

cross-case focal conjunct EP and within-case mechanisms

## 6 Chapter 6: Brethauer (2015)

In chapter 6, I use the study by Brethauer (2015) on peace and conflict in resource-scarce countries to illustrate SMMR on necessity claims of various levels of complexity ( $A \Leftarrow Y$ ,  $A + B \Leftarrow Y$ , and  $A * B \Leftarrow Y$ ).

*Outcome*

- BDT = Conflict

*Conditions*

- PIN = Low Quality of Political Institutions
- COR = Political corruption
- EEX = Ethnic exclusion
- POV = Poverty
- DEP = Dependence on agriculture
- EDU = High tertiary education
- ECOD = Economic development

```
#Load data
BRETT <- read.csv("Brethauer_2014_fs.csv", row.names =1)

colnames(BRETT) <- toupper(colnames(BRETT))
```

### 6.1 $A \Leftarrow Y$

First, we identify the necessary condition  $\sim DEP$  and visualize it via an X plot.

```
# Analysis of single necessity, outcome ~Y
NEC_ny <- superSubset(data = BRETT,
                       outcome = 'BDT',
                       conditions = c("POV", "DEP", "COR", "PIN", "EDU",
                                     "EEX"),
                       incl.cut = 0.89,
                       ron.cut = 0.6,
                       cov.cut = 0.5,

### 6.1.1 Descriptive inference SMMR

In the following, I show the four single-case and comparative SMMR designs with the goal of enhancing descriptive inferences.

I start with the best available deviant relevance case.

```
# For technical reasons, a solution object from function minimize() is
needed, even if one is not interested in an analysis of sufficiency. I
therefore produce a truth table analysis of sufficiency, outcome ~Y
sol_np <- minimize(BRETT,
                     outcome = "~BDT",
                     conditions = c("POV", "DEP", "ECOD", "COR", "PIN",
"EDU", "EEX"),
                     incl.cut = 0.75,
                     pri.cut = 0.5,
```

```

        details = TRUE,
        include = "?",
        row.dom = TRUE)

# Deviant relevance
drel <- smmr(nec.cond = "~DEP",
              results = sol_np,
              outcome = "~BDT",
              match = FALSE,
              cases = 3,
              necessity = TRUE)
drel

~DEP :
-----
      Case NecCond Outcome Best MostDREL
1   Algeria    0.85  0.00 0.30     TRUE
6 Uzbekistan  0.83  0.30 0.64    FALSE
4 Kyrgyzstan  0.90  0.48 0.68    FALSE
3   Jamaica   0.87  0.43 0.69    FALSE
2    Egypt    0.66  0.14 0.82    FALSE
5   Lesotho   0.63  0.47 1.21    FALSE

```

The best pairs of typical - deviant relevance cases are listed here.

```

# typical - deviant relevance
typdrel <- smmr(nec.cond = "DEP",
                  results = sol_np,
                  outcome = "~BDT",
                  match = TRUE,
                  cases = 1,
                  max_pairs = 10,
                  necessity = TRUE)
typdrel

~DEP :
-----
      TYP      DREL Best MostTyp MostDREL

8 South Korea  Algeria 0.35    TRUE     TRUE
9 Switzerland  Algeria 0.35    TRUE     TRUE
1       Bahrain Algeria 0.35   FALSE    TRUE
2        Japan  Algeria 0.35   FALSE    TRUE
4       Kuwait  Algeria 0.35   FALSE    TRUE
5 Netherlands  Algeria 0.35   FALSE    TRUE
6        Qatar  Algeria 0.35   FALSE    TRUE
7   Singapore  Algeria 0.35   FALSE    TRUE
10 United Arab Emirates  Algeria 0.35   FALSE    TRUE

```

The best available deviant consistency cases are shown as below. As could be seen from the XY plot, there is just one such case in the data: Bhutan. What the output adds to this is information of the truth table row to which Bhutan belongs.

```
# deviant consistency
dcons <- smmr(nec.cond = "~DEP",
               results = sol_np,
               outcome = "~BDT",
               match = FALSE,
               cases = 2,
               necessity = TRUE)
dcons
~DEP :
-----
   Case NecCond TT_POV TT_DEP TT_ECOD TT_COR TT_PIN TT_EDU TT_EEX TT_row
1 Bhutan     0.01      1      1      0      0      0      1      1    0.72
  Outcome TT<=Y Best MostDCONS
1     0.95  TRUE  0.06      TRUE
```

The best available pair of typical and deviant consistency cases is shown below. As we see, no typical case shares with Bhutan the same truth table (minus the necessary condition  $\sim DEP$ , of course, in which both case types hold different membership scores, by definition).

```
# typical - deviant consistency
typdcons <- smmr(nec.cond = "~DEP",
                   results = sol_np,
                   outcome = "~BDT",
                   match = TRUE,
                   cases = 2,
                   max_pairs = 10,
                   necessity = TRUE)
typdcons
~DEP :
-----
[1] "There are no pairs in the same TT row"
```

### 6.1.2 Causal inference SMMR

Now I turn to the three causal inference SMMR designs.

I start with a single typical case.

```
# typical case
typ <- smmr(nec.cond = "~DEP",
             results = sol_np,
             outcome = "~BDT",
             match = FALSE,
             cases = 1,
```

```

necessity = TRUE)
typ
~DEP :
-----

```

	Case	NecCond	Outcome	UniqCov	Best	MostTyp
3	Jordan	0.96	0.95	TRUE	0.06	TRUE
8	South Korea	0.96	0.95	TRUE	0.06	TRUE
9	Switzerland	0.96	0.95	TRUE	0.06	TRUE
2	Japan	0.97	0.95	TRUE	0.07	FALSE
5	Netherlands	0.97	0.95	TRUE	0.07	FALSE
10	United Arab Emirates	0.97	0.95	TRUE	0.07	FALSE
1	Bahrain	0.98	0.95	TRUE	0.08	FALSE
4	Kuwait	0.98	0.95	TRUE	0.08	FALSE
6	Qatar	0.98	0.95	TRUE	0.08	FALSE
7	Singapore	0.98	0.95	TRUE	0.08	FALSE

The best-matching pairs of typical and iir cases are listed below.

```

# typical - iir
typiir <- smmr(nec.cond = "~DEP",
                 results = sol_np,
                 outcome = "~BDT",
                 match = TRUE,
                 cases = 3,
                 max_pairs = 10,
                 necessity = TRUE)
typiir
~DEP :
-----

```

	TYP	IIR	UniqCov	GlobUncov	Best	MostTyp
3	Jordan	Burundi	TRUE	TRUE	0.13	TRUE
8	South Korea	Burundi	TRUE	TRUE	0.13	TRUE
9	Switzerland	Burundi	TRUE	TRUE	0.13	TRUE
23	Jordan	Nepal	TRUE	TRUE	0.13	TRUE
28	South Korea	Nepal	TRUE	TRUE	0.13	TRUE
29	Switzerland	Nepal	TRUE	TRUE	0.13	TRUE

```

## 6.2 $A + B \Leftarrow Y$

For illustrating SMMR in the presence of SUIN conditions, I continue with the example by Bretthauer (2015). Now the outcome consists in the presence of conflict (*BDT*). The necessity claim consisting of SUIN conditions looks as follows:

```

# Analysis of SUIN necessity, outcome BDT
SUIN_y <- superSubset(data = BRETT,
                       outcome = 'BDT',
                       conditions = c("POV", "DEP", "COR", "PIN", "EDU",
"EX"),
                       incl.cut = 0.94,
                       ron.cut = 0.6,
                       cov.cut = 0.5,
                       depth = 2)
SUIN_y

      inclN   RoN   covN
-----
1 POV + COR  0.943  0.625  0.637
-----

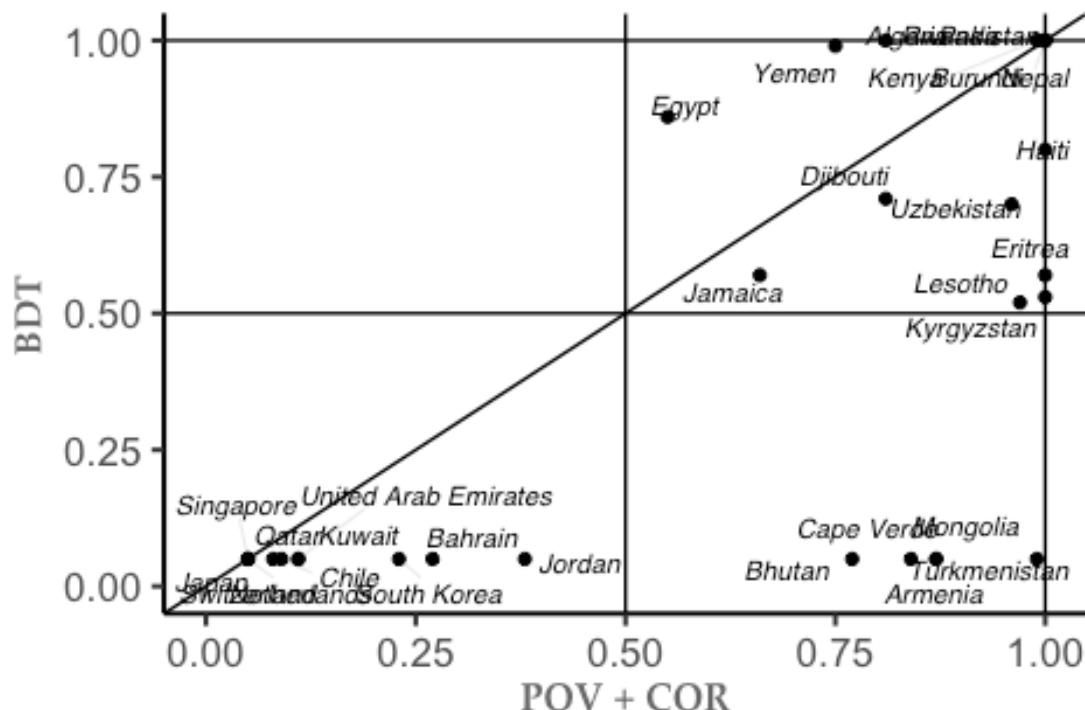

#Visualize via XY plot
BRETT$POVCOR <- pmax(BRETT$POV, BRETT$COR)

xy.plot(data = BRETT,
        'POVCOR', 'BDT',
        necessity = TRUE,
        xlab = 'POV + COR',
        ylab = 'BDT',
        jitter = TRUE)

```

# XY plot

Cons.Nec: 0.943; Cov.Nec: 0.637; RoN: 0.625

## 6.2.1 Descriptive inference SMMR

I start with descriptive inference SMMR designs, and here with the study of a deviant relevance case. As can be seen, they are automatically listed for each SUIN condition and for the disjunction of SUIN conditions. This holds for all other SMMR designs involving SUIN conditions.

```
# For technical reasons, a solution object from function minimize() is
# needed, even if one is not interested in an analysis of sufficiency. I
# therefore produce a truth table analysis of sufficiency, outcome ~Y

sol_p<- minimize(BRETT, outcome = "BDT",
                   conditions = c("POV", "DEP", "ECOD", "COR", "PIN",
"EDU", "EEX"),
                   incl.cut1 = 0.75,
                   pri.cut = 0.5,
                   include = "?",
                   details = TRUE,
                   row.dom = TRUE)

# deviant relevance
drel <- smmr(nec.cond = "POV+COR",
             results = sol_p,
```

```

        outcome = "BDT",
        match = FALSE,
        cases = 3,
        necessity = TRUE)
drel

POV :

### 6.3 $A * B \Leftarrow Y$

I illustrate SMMR in the presence of a necessary conjunction with outcome  $BDT$  from the study by Bretthauer (2015). For illustrative purposes, let us accept the conjunction  $\sim ECOD * \sim EDU$  as a necessary conjunction for outcome  $BDT$ .

```
# parameters of fit for conjunction
NEC_conj <- pof(data = BRETT,
  ~ECOD * ~EDU <- BDT)

NEC_conj

      inclN    RoN    covN
-----
1 ~ECOD*~EDU  0.854  0.832  0.769
-----

# create conjunction set in data set
BRETT$ECODEDU <- pmin(1-BRETT$ECOD, 1-BRETT$EDU)

# XY plot for conjunction
xy.plot(data = BRETT,
  'ECODEDU', 'BDT',
  necessity = TRUE,
  xlab = '~~ECOD*~EDU',
  ylab = 'BDT',
  jitter = TRUE)
```

# XY plot

Cons.Nec: 0.854; Cov.Nec: 0.769; RoN: 0.832

### 6.3.1 Descriptive inference SMMR

As before, I start with the four descriptive inference SMMR designs. Since the focal conjunct principle does not apply to descriptive inference SMMR designs, the output only shows cases for the conjunction, not each ININ condition separately.

As can be seen, there are only two deviant relevance cases.

```
# Deviant Rel.
drel <- smmr(nec.cond = "~ECOD*~EDU",
             results = sol_p,
             outcome = "BDT",
             match = FALSE,
             cases = 3,
             necessity = TRUE)
drel
~ECOD*~EDU :
-----
   Case NecCond Outcome Best MostDREL
1  Cape Verde     0.83    0.05  0.39      TRUE
2      Jordan     0.55    0.05  0.95     FALSE
```

There are more pairs of typical and deviant relevance cases, all of them involving, of course, the two deviant relevance cases of either Cape Verde and Jordan.

```
# TYP - DREL
typdrel <- smmr(nec.cond = "~ECOD*~EDU",
                  results = sol_p,
                  outcome = "BDT",
                  match = TRUE,
                  cases = 1,
                  max_pairs = 10,
                  necessity = TRUE)
typdrel
~ECOD*~EDU :
-----
      TYP      DREL Best MostTyp MostDREL
2   Egypt    Cape Verde 0.53   TRUE   TRUE
4   Haiti    Cape Verde 0.59   FALSE  TRUE
1 Djibouti  Cape Verde 0.68   FALSE  TRUE
3 Eritrea   Cape Verde 0.82   FALSE  TRUE
5 Lesotho   Cape Verde 0.86   FALSE  TRUE
7   Egypt     Jordan 1.09   TRUE  FALSE
9   Haiti     Jordan 1.15   FALSE  FALSE
6 Djibouti   Jordan 1.24   FALSE  FALSE
8 Eritrea   Jordan 1.38   FALSE  FALSE
10 Lesotho   Jordan 1.42   FALSE  FALSE
```

There are also just three deviant consistency cases. All three sit in different truth table rows.

```
# Deviant Cons.
dcons <- smmr(nec.cond = "~ECOD*~EDU",
               results = sol_p,
               outcome = "BDT",
               match = FALSE,
               cases = 2,
               necessity = TRUE)

```

```

1   0.57 TRUE 0.89      TRUE
3   0.70 FALSE 0.31     TRUE

```

As the output below shows, no typical case shares the same truth table row with any of the three deviant consistency cases.

```

# TYP - DCN
typdcons <- smmr(nec.cond = "~ECOD*~EDU",
                    results = sol_p,
                    outcome = "BDT",
                    match = TRUE,
                    cases = 2,
                    max_pairs = 10,
                    necessity = TRUE)
typdcons
~ECOD*~EDU :
-----
[1] "There are no pairs in the same TT row"

```

### 6.3.2 Causal inference SMMR

For causal inference designs, the focal conjunct principle applies and the best available (pairs of) cases are listed for each ININ cause and the necessary conjunction separately.

Single typical cases are listed below.

```

# TYP
typ <- smmr(nec.cond = "~ECOD*~EDU",
              results = sol_p,
              outcome = "BDT",
              match = FALSE,
              cases = 1,
              necessity = TRUE)
typ
~ECOD :
-----
Case NecCond Outcome Rank CleanCorr UniqCov Best MostTyp
2 Egypt    0.92    0.86   1    FALSE  FALSE 0.20   TRUE
4 Haiti    0.97    0.80   1    FALSE  FALSE 0.37   FALSE
3 Eritrea  0.98    0.57   1    FALSE  FALSE 0.84   FALSE
1 Djibouti 0.92    0.71   2    TRUE   FALSE 0.50   FALSE
5 Lesotho  0.97    0.53   2    TRUE   FALSE 0.91   FALSE

~EDU :
-----
Case NecCond Outcome Rank CleanCorr UniqCov Best MostTyp
1 Djibouti 0.97    0.71   1    FALSE  FALSE 0.55   FALSE
2 Egypt    0.88    0.86   2    TRUE   FALSE 0.16   TRUE
4 Haiti    0.96    0.80   2    TRUE   FALSE 0.36   FALSE

```

```

3 Eritrea    0.97    0.57    2      TRUE   FALSE  0.83   FALSE
5 Lesotho     0.97    0.53    2      TRUE   FALSE  0.91   FALSE

```

~ECOD\*~EDU :

```

-----  

Case NecCond Outcome UniqCov Best MostTyp  

2 Egypt    0.88    0.86    TRUE  0.16   TRUE  

4 Haiti     0.96    0.80    TRUE  0.36   FALSE  

1 Djibouti  0.92    0.71    TRUE  0.50   FALSE
